

How to disassemble the lead-acid battery electrodes

Overview

Before 1960, the dismantling of batteries was mainly with the help of axes, because organics were not allowed to enter the furnace during the processing process, and the battery could not be directly added to the furnace. While this situation has now improved in many countries, especially in developed countries, it. To minimize human contact with the battery dismantling process, the spent batteries should be transported to the open apparatus by automatic conveyor belts or small vehicles as much as possible. Once the battery. Various contaminations may exist in lead recycling. Several common situations that affect the environment during the battery disassembly and pretreatment process are: battery leakage.
