

How to replace the integrated valve of solar energy

Overview

Domestic water that is high in mineral content (or "hard water") may cause the buildup or scaling of mineral (calcium) deposits on heat transfer surfaces. Scale buildup reduces system performance in a number of ways. Most well-designed solar systems experience minimal corrosion. When they do, it is usually galvanic corrosion, an electrolytic process caused by two dissimilar metals. Solar water heating systems, which use liquids as heat-transfer fluids, need protection from freezing in climates where temperatures fall below 42°F (6°C). Don't rely on a collector. Overheating occurs when there is little hot water use in the home but the sun continues to heat the water. The controller will turn the pump off when the solar storage tank hits. Solar water heating systems that use only water as a heat-transfer fluid are the most vulnerable to freeze damage. "Draindown" or "drainback" systems typically use a controller to drain.
